

Serial No. 09/935,012

PATENT
Docket No. 58027-011500**CLAIM AMENDMENTS**

Claim 1 (previously amended): A distributed Bragg reflector for use in a vertical cavity surface emitting laser, comprising a plurality of layers of semiconductor material doped to reduce voltage drop and optical loss in a vertical cavity surface emitting laser, the plurality of layers including at least one layer having the element antimony (Sb), and at least one layer being substantially composed of an indium phosphide (InP) compound, wherein the plurality of layers of semiconductor material also including the elements arsenic, aluminum, and gallium.

Claim 2 (original): The distributed Bragg reflector of claim 1, wherein the plurality of layers of semiconductor material are epitaxially grown on a substrate.

Claim 3 (original): The distributed Bragg reflector of claim 2, wherein the substrate includes indium phosphide (InP).

Claim 4 (original): The distributed Bragg reflector of claim 2, wherein the plurality of layers are comprised of alternating layer pairs of $\text{Al}_a\text{Ga}_{1-a}\text{As}_b\text{Sb}_{1-b}$ which are approximately lattice-matched to InP, and where "a" and "b" indicate relative proportions of atoms.

Claim 5 (original): The distributed Bragg reflector of claim 4, wherein "a" is greater than 0.9 in one layer of the alternating layer pairs and less than 0.9 in another layer of the alternating layer pairs.

Claim 6 (original): The distributed Bragg reflector of claim 4, wherein "a" is less than 0.3 in one layer of the alternating layer pairs and greater than 0.3 in another layer of the alternating layer pairs.

Claim 7 (original): The distributed Bragg reflector of claim 4, wherein "a" is less than 0.3 in one layer of the alternating layer pairs and greater than 0.9 in another layer of the alternating layer pairs.

Docket No. 58027-011500

Claim 8 (original): The distributed Bragg reflector of claim 4, wherein "a" is less than 0.3 in one layer of the alternating layer pairs and "a" is large enough such that the layer is substantially transparent to lasing light.

Claim 9 (original): The distributed Bragg reflector of claim 2, wherein the substrate is n-doped with the element selenium (Se).

Claim 10 (original): The distributed Bragg reflector of claim 1, wherein the plurality of layers of semiconductor material are configured to form a reflective device.

Claim 11 (original): The distributed Bragg reflector of claim 10, wherein the reflective device is n-doped using tellurium.

Claim 12 (previously amended): A device for reflecting light to an active region in a vertical cavity surface emitting laser, comprising:

a mirror portion including the element antimony (Sb) and an indium phosphide (InP) compound epitaxially grown on a substrate, the mirror portion including a plurality of layers of semiconductor material, wherein electric current is pumped through the plurality of layers forming the mirror portion to electrically pump the active region.

Claim 13 (original): The device of claim 12, wherein the substrate includes indium phosphide (InP).

Claim 14 (original): The device of claim 13, wherein the substrate is n-doped with the element selenium (Se).

Claim 15 (original): The device of claim 12, wherein the mirror portion is n-doped to reduce voltage drop and optical loss in a vertical cavity surface emitting laser.

Claim 16 (original): The device of claim 15, wherein the mirror portion is n-doped using tellurium.

PATENT
Docket No. 58027-011500

Claim 17 (previously amended): A vertical cavity surface emitting laser, comprising:

a pair of mirror portions epitaxially grown on a substrate, the pair of mirror portions including a plurality of layered stacks of paired semiconductor material, wherein the pair of mirror portions are n-doped to reduce voltage drop and optical loss;

wherein each of the pair of mirror portions includes at least one of the element antimony (Sb) and the compound indium phosphide (InP);

an active region epitaxially grown on the substrate and positioned between the pair of mirror portions;

a doped tunnel junction configured to provide electron-hole conversion from one of the pair of mirror portions; and

wherein the pair of mirror portions, the active region, and the tunnel junction are epitaxially grown on the substrate in a single step, and wherein electric current is pumped through the pair of mirror portions to electrically pump the active region.

Claim 18 (original): The vertical cavity surface emitting laser of claim 17, wherein the substrate includes indium phosphide (InP).

Claim 19 (original): The distributed Bragg reflector of claim 17, wherein the plurality of layers are comprised of alternating layer pairs of $\text{Al}_a\text{Ga}_{1-a}\text{As}_b\text{Sb}_{1-b}$ which are approximately lattice-matched to InP, where "a" and "b" indicate relative proportions of the atoms.

Claim 20 (original): The distributed Bragg reflector of claim 19, wherein "a" is greater than 0.9 in one layer of the alternating layer pairs and less than 0.9 in another layer of the alternating layer pairs.

Claim 21 (original): The distributed Bragg reflector of claim 19, wherein "a" is less than 0.3 in one layer of the alternating layer pairs and greater than 0.3 in another layer of the alternating layer pairs.

Claim 22 (original): The distributed Bragg reflector of claim 19, wherein "a" is less than 0.3 in one layer of the alternating layer pairs and greater than 0.9 in another layer of the alternating layer pairs.

Docket No. 58027-011500

Claim 23 (original): The distributed Bragg reflector of claim 19, wherein "a" is less than 0.3 in one layer of the alternating layer pairs and "a" is large enough such that the layer is substantially transparent to lasing light.

Claim 24 (original): The vertical cavity surface emitting laser of claim 17, wherein the substrate is n-doped with the element selenium (Se).

Claim 25 (original): The vertical cavity surface emitting laser of claim 17, wherein the doped tunnel junction is n-doped with silicon (Si).

Claim 26 (original): The vertical cavity surface emitting laser of claim 17, wherein the doped tunnel junction is p-doped with CBr4.

Claim 27 (original): The vertical cavity surface emitting laser of claim 17, wherein the pair of mirror portions include a first mirror portion positioned on a top of the active region and a second mirror portion positioned below the active region.

Claim 28 (original): The vertical cavity surface emitting laser of claim 27, wherein the first and second mirror portions are n-doped using tellurium.

Claim 29 (original): The vertical cavity surface emitting laser of claim 17, wherein the active region is grown to include a cavity having five strain compensated quantum wells, the quantum wells including the elements aluminum, indium, gallium, and arsenic.

Claim 30 (original): The vertical cavity surface emitting laser of claim 17, wherein the VCSEL operates in the approximate range from between 1.3 microns and 1.6 microns.

Claim 31 (previously amended): A vertical cavity surface emitting laser comprising:

a substrate on which a pair of mirror portions, an active region, and a tunnel junction are epitaxially grown in a single step in which semiconductor elements are deposited to form a multi-layered structure;

wherein each of the pair of mirror portions includes at least one of the element antimony (Sb) and the compound indium phosphide (InP); and

at least one metal contact disposed on the substrate, wherein electric current is pumped through the pair of mirror portions to electrically pump the active region.

Claim 32 (original): The vertical cavity surface emitting laser of claim 21, wherein the substrate includes indium phosphide (InP).

Claim 33 (original): The distributed Bragg reflector of claim 32, wherein the plurality of layers are comprised of alternating layer pairs of $\text{Al}_a\text{Ga}_{1-a}\text{As}_b\text{Sb}_{1-b}$ which are approximately lattice-matched to InP, where "a" and "b" indicate relative proportions of the atoms.

Claim 34 (original): The distributed Bragg reflector of claim 33, wherein "a" is greater than 0.9 in one layer of the alternating layer pairs and less than 0.9 in another layer of the alternating layer pairs.

Claim 35 (original): The distributed Bragg reflector of claim 33, wherein "a" is less than 0.3 in one layer of the alternating layer pairs and greater than 0.3 in another layer of the alternating layer pairs.

Claim 36 (original): The distributed Bragg reflector of claim 33, wherein "a" is less than 0.3 in one layer of the alternating layer pairs and greater than 0.9 in another layer of the alternating layer pairs.

Claim 37 (original): The distributed Bragg reflector of claim 33, wherein "a" is less than 0.3 in one layer of the alternating layer pairs and "a" is large enough such that the layer is substantially transparent to lasing light.

Claim 38 (original): The vertical cavity surface emitting laser of claim 31, wherein the substrate is n-doped with the element selenium (Se).

Claim 39 (original): The vertical cavity surface emitting laser of claim 31, wherein the doped tunnel junction is n-doped with silicon (Si).
